## Chapter 2: Waste Management

**Page 2-51, Section 2.4.9c Lead Acid Batteries:** Incorrect page reference to Land Disposal Restrictions. Should reference section 2.4.5.c.

Page 2-60, Section 2.4.9.1: Replaced “printer” with “fixer recycler” where bolded below.

### **Used developer and system cleaners:**

Check if the waste water treatment plant will allow discharges of used developer and system cleaners. If not, check if the fixer recycler will accept the used developer. If the **fixer recycler** is not taking the used developer themselves to a destination facility, hire a permitted and registered transporter when shipping used developer off-site as liquid industrial waste and manifest the load using a 033L liquid industrial waste code. Do not mix used fixer and developer. Cleaners used in developer systems may contain chromium. Review the MSDS and other information to determine if the waste cleaner has a chromium TCLP concentration of 5.0 mg/l or more. If so, it would be considered a D007 hazardous waste. If possible, switch to a nonchromium cleaner.

**If you have questions, please contact the Environmental Assistance Center at (800) 662-9278.**
