Michigan's Composting Law

Prior to the 1995 law banning yard clippings from Michigan's landfills and incinerators, leaves and grass comprised over 30% of all household solid waste generated. Not only is that a lot of space being filled by a clean resource, but yard clippings in landfills may contribute to methane gas and leachate production which pollute the air and local water supplies. The moisture in yard waste causes it to burn poorly in incinerators, raising pollution levels, and operating costs. Because of the many problems caused by yard clippings in landfills, starting in 1995, yard clippings were banned from Michigan landfills. Yard clippings are defined as leaves, grass clippings, vegetable or other garden debris, shrubbery, or brush or tree trimmings, less than 4 feet in length and 2 inches in diameter, that can be converted to compost humus.

Why Compost?

The best method for getting rid of yard waste is also the easiest. Composting is nature's way of turning your yard "waste" into a valuable soil conditioner.

Composting:

- **Saves you money** by reducing the need for expensive bags and commercial soil additives.
- **Helps your garden and lawn** by improving the fertility and health of your soil.
- **Saves water** by helping the soil hold moisture and reducing water runoff.
- **Benefits the environment** by recycling valuable organic resources and extending the lives of our landfills.

What Can You Compost?

**Do Compost**
- grass clippings
- leaves
- weeds & garden debris
- small brush, twigs
- clean wood ash
- sawdust & wood chips
- egg shells
- coffee grounds

**Do Not Compost**
- whole branches, logs
- pet or human waste
- charcoal briquette ash
- sawdust from treated wood

Contact your local community recycling staff for additional information about backyard composting and to find out about what can and cannot be composted in your community.
Composting is a lot easier than you may think. Organic material breaks down around us in nature all the time. Composting is just a method of speeding up the process!

Most compost bin designs are so simple they can be built in a few hours. Once you gather your yard waste and form it into a pile, the only time you’ll spend is for occasional maintenance. Then sit back and let nature do the rest!

**Composting Equipment**

**Tools**
All you need are some basic gardening tools, like a pitchfork, a rake, and a shovel.

**Materials**
Compost bins can be built with inexpensive materials like snow fencing, woven wire, or used cinder blocks and lumber.

**Soil**
You don’t need store-bought “soil activators” or potting soil to compost. One inch of soil from your yard or garden has all the ingredients needed to start the composting process.

**Composting Bins**

Here are three simple ways to make compost bins:

**Snow Fence Bin**
Buy a length of prefabricated snow fence and fasten two by fours to each corner to form a square. (For a 4’x4’x4’ compost pile, purchase 16 feet of snow fencing.)

**Woven Wire Bin**
Purchase a length of woven wire and fasten the ends with several small chain snaps (available at any hardware store) to make a circle. To calculate the length of wire needed, lay a piece of string around the outside of the pile and measure it. (For a 4’x4’x4’ compost pile, purchase 16 feet of woven wire.)

**Block or Brick Bin**
Pile up bricks, cement blocks, or rocks to form three sides of a square container. Lay the blocks without mortar, leaving spaces between to let air circulate.

**Composting Recipes**

**Shopping List:**
- **Green yard waste:** grass clippings, green yard trimmings, and weeds.
- **Brown yard waste:** leaves, small brush and twigs (1/2” diameter or less), woody plant prunings, sawdust.

**Lazy Person’s Compost**

**Ingredients:**
- Green and brown yard waste, water as needed.

**Directions:**
- In a heap or bin, layer your yard waste as it accumulates. For faster composting, chop it up first with a hoe or lawn mower.
- Water so compost is kept as moist as a wrung-out sponge.
- In a year to 18 months, the material at the bottom and center of the pile will be dark, crumbly compost. Sift, and use the uncomposted material to start a new batch.

**Fast Compost**

**Ingredients:**
- Green and brown yard waste, water as needed.

**Directions:**
- Mix one part green yard waste with two parts brown to form a pile (an average size is 4’x4’x4’). For fast composting, chop it up first with a hoe or lawn mower.
- Mix in one inch of soil.
- Keep the pile as moist as a wrung-out sponge.
- Turn the pile every week to let air in.
- Finished compost will take between four weeks and one year, depending on how often you turn it and how well you maintain the moisture of the pile.

**Composting Made Simple**

Composting is a lot easier than you may think. Organic material breaks down around us in nature all the time. Composting is just a method of speeding up the process!
